**How to Calculate Mil Thickness**

Theoretical: 1 gallon of 100% solids material applied over 100 sq. ft. yields 16 dry mils.

Dry Mil Thickness = 
$$\frac{\text{Gallons per 100 sq.ft.} \times 16 \times \% \text{ Solids by Volume}}{100}$$

Gallons per 100 sq. ft. = 
$$\frac{\text{Dry Mil Thickness} \times 100}{16 \times \% \text{ Solids by Volume}}$$

**Measures of Length**

12 inches = 1 foot                      1 sq. ft. = 144 sq. in.  
 1 sq. yd. = 9 sq. ft.                    1 sq. mile = 640 acres  
 1 acre = 4840 sq. yd. = 43,560 sq. ft.  
 100 mm<sup>2</sup> = 1 cm<sup>2</sup>                      10,000 cm<sup>2</sup> = 1 m<sup>2</sup>

**Measures of Weight**

16 ounces = 1 pound                    1000 grams = 1 kg  
 2000 pounds = 1 net ton                1000 kg = 1 metric ton

**Sealant Estimation**

Linear feet per full gallon (231 cubic inch)

		Width of Joint
